

What is body mass index (BMI)?

BMI is one of two key measures used to find out if someone is overweight or obese. The other measure is your waistline. BMI uses your weight and height to estimate your total body fat. Use the chart below to find your BMI number.

What's your BMI number?

Body Mass Index

Body mass index table

	Normal					Overweight					Obese					Extreme obesity																				
BMI	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51	52	53	54
Height (inches)	Body weight (pounds)																																			
58	91	96	100	105	110	115	119	124	129	134	138	143	148	153	158	162	167	172	177	181	186	191	196	201	205	210	215	220	224	229	234	239	244	248	253	258

What does your BMI number mean?

The chart on the previous page shows which weight category (normal to extreme obesity) your BMI number falls into, but the table below may be a bit easier to read. In general, overweight is defined as a BMI of 25 to 29.9 and obesity is defined as a BMI equal to or greater than 30.

BMI weight categories

Normal	Underweight	Overweight	Obese	Morbid obesity
20-24	< 19 for women	25-29	30-39	40-54
	< 20 for men

Do you need to lower your BMI?

If your BMI number is above normal, there are things you can do to change it. Talk to your doctor about eating healthier and exercising. Being overweight or obese increases your risk for several health conditions including high blood pressure, diabetes, high cholesterol and heart disease.

If you need to lose weight, do it slowly. Lose no more than 1/2 pound to 2 pounds per week. This is the healthiest way to lose weight and offers the best chance of long-term success.

Your waistline story

BMI is not the only factor that determines your risk for certain health conditions. Muscle mass or fluid retention can affect a BMI reading. That's why waist measurement is often checked as well. A waist of more than 35 inches around in women and 40 in men is considered the danger zone.
